

IN THE CLAIMS:

Please cancel claims 1, 2, 4, 6, 29 and 75 as shown below.

Claims 1-8 (Cancelled).

Claim 9 (Previously Presented): A method for estimating a maximum discharge power of a battery, comprising:

generating a signal indicative of a present state-of-charge of said battery, utilizing a sensor;

calculating said present state-of-charge of said battery based on said signal, utilizing an arithmetic circuit operably coupled to said sensor;

calculating a maximum discharge current of said battery utilizing said arithmetic circuit based on at least a minimum state-of-charge limit associated with said battery, said present state-of-charge of said battery, a minimum voltage limit associated with said battery, and a cell model that is solved by a Taylor-series expansion, such that a future output voltage of said battery does not fall below said minimum voltage limit and a future state-of-charge of said battery does not fall below said minimum state-of-charge limit associated with said battery; and,

calculating said maximum discharge power based on said maximum discharge current value, utilizing said arithmetic circuit.

Claim 10 (Cancelled).

Claim 11 (Original): The method of claim 9 wherein said cell model is solved by using a discrete time-state space model.

Claim 12 (Previously Presented): The method of claim 9 wherein said battery is a battery pack comprising at least one cell.

Claim 13 (Previously Presented): The method of claim 12 wherein said cell model is

$$v_k(t+\Delta t) = OCV(z_k(t+\Delta t)) \cdot R \times i_k(t)$$

wherein  $v_k(t+\Delta t)$  denotes a cell voltage for a cell  $k$  for a time period  $\Delta t$  units into the future,  $OCV(z_k(t+\Delta t))$  denotes an open cell voltage as a function of a state-of-charge  $z_k$  for cell  $k$  for a time period  $\Delta t$  units into the future,  $R$  is a constant that denotes an internal resistance of said cell  $k$ , and  $i_k(t)$  denotes a cell current for cell  $k$ .

Claims 14-15 (Cancelled).

Claim 16 (Original): The method of claim 13 wherein said cell model is solved by using a discrete time-state space model.

Claim 17 (Previously Presented): The method of claim 16 wherein said discrete time-state space model is

$$x_k[m+1] = f(x_k[m], u_k[m])$$

$$v_k[m] = g(x_k[m], u_k[m])$$

wherein  $m$  denotes a discrete time sample index,  $x_k[m]$  denotes a vector function of time and a state of the battery,  $u_k[m]$  denotes an input to the battery and includes cell current  $i_k[m]$  as a component, and  $f(\cdot)$  and  $g(\cdot)$  are functions chosen to model cell dynamics.

Claims 18-20 (Cancelled).

Claim 21 (Previously Presented): The method of claim 17 wherein  $i_{max,k}^{dis,vol}$  is found by looking for  $i_k$  that causes equality in

$$v_{min} = g(x_k[m+T], u_k[m+T])$$

wherein  $g(x_k[m+T], u_k[m+T])$  is utilized to determine the cell voltage for the cell  $k$  at a predetermined time in the future.

Claims 22-75 (Cancelled).
